## Dirickx Beijing factory: protocol in case of chemical splashes

The Dirickx Group is an international specialist in perimeter protection. Our activity in China, apart from sales, also includes fences and gates production in our Beijing based factory.

On our this production site,  $\text{NaOH}$ ,  $\text{Ca(OH)}_2$  and 98%  $\text{H}_2\text{SO}_4$  are used during waste water treatment.

In order to ensure our employees could be properly protected against chemical splashes and prevent serious chemical burns from occurring if splashed, we decided to equip the waste water treatment station with Prevor's products after we met their chemical engineer. DIPHOTÉRINE® MINI DAP and DIPHOTÉRINE® Eyewashes were thus purchased in February 2013. During the post-purchase training, Prevor's engineer introduced us chemical risks, the development of chemical burns and how to avoid them, as well as DIPHOTÉRINE® use protocol. The training allowed concerned employees to deepen their understanding of chemical risks and the necessity to protect themselves properly while manipulating chemicals.
